

JET COWLS

The Pinnacle Jet Cowl range is designed for industrial and commercial ventilation systems;

- Vertical discharge roof cowl
- Manufactured from Galvanised Steel to DW144
- High quality finish
- Contains internal rain funnel to collect rain and snow which is drained out of the hood via hose
- Designed to connect directly to spiral ducting
- Rolled edge for safer handling and improved alignment

Advantages of Jet Cowls v Round Cowls;

- Air is expelled and directed vertically rather than laterally, helping reduce the potential of exhaust fumes becoming an issue to neighbouring buildings
- Fresh air inlet can be installed within close proximity
- Vertical duct above roof can often be shorter than it would otherwise need to be with a standard cowl
